PUTRA AJRIL FATAH

putraajril2@gmail.com | ajrilfatah.vercel.app| Yogyakarta, Indonesia

SUMMARY

Full Stack Developer with 1+ year at a software house, building multi-tenant, offline-first, and financial-transaction systems (POS, payroll, escrow, ledgers) with Laravel, Svelte 5, PostgreSQL, and Redis. Handles the full cycle from client requirements to architecture, sprint planning, and deployment. Secondary experience in Solidity smart contracts and Web3 applications.

EDUCATION

Universitas Amikom Yogyakarta | Bachelor of Informatics 2022 – 2026

Graduated June 2026 | Final GPA: 3.32/4.00

Thesis: Implementation of a Blockchain- and IPFS-Based Digital Document Notarization System Using Smart Contracts on Base Layer 2 (Velipe, see Projects) | Grade: A

EXPERIENCE

Full Stack Developer, Munk Studio 2025 – 2026

- Led communication with clients and translated business requirements into technical specs for projects, some of them live in production.
- Architected system design and selected tech stacks per project, delivering projects on schedule.
- Planned and ran sprints for a team, covering frontend, backend, and deployment.
- Built and maintained full-stack web and Web3 applications.

SELECTED PROJECTS

Solvio: Multi-Tenant F&B Operating System and Offline-First POS | *Laravel 12 (Octane/FrankenPHP), Svelte 5, TypeScript, PostgreSQL, Redis, Dexie.js*

- Built an offline-first POS PWA using IndexedDB (Dexie.js) and an idempotent outbox sync engine, designed so no transaction is lost during network outages.
- Architected daily stock opname and inventory reconciliation with unit-conversion tracking and asynchronous snapshot recalculation.
- Linked geofenced shift attendance directly to dynamic payroll computation, including penalty and salary slip logic.
- Designed a high-concurrency monorepo on Laravel Octane with PostgreSQL time-series aggregations and stratified Redis caching across isolated workspaces and multi-branch outlets.

SiPandu-DM: Offline-First Mobile App for Type 2 Diabetes Risk Monitoring | *Flutter, FastAPI, PostgreSQL, Drift, Docker*

- Engineered an offline-first mobile app with a strict 3-tier architecture for community-level health monitoring in low-connectivity areas.
- Implemented local-to-server synchronization with the Outbox Pattern for reliable data delivery.
- Secured the FastAPI backend with AES-256-GCM encryption and Role-Based Access Control to protect medical data.

Billet: On-Chain Anti-Scalping Ticketing Protocol | *Solidity, Foundry, Next.js, Wagmi, Ponder, Base L2*

- Built an ERC-1155 ticketing protocol on Base with trustless escrow and enforced on-chain price ceilings on the secondary market.
- Implemented conditional royalty routing (ERC-2981) to manage organizer revenue automatically.
- Designed a decoupled architecture: smart contracts, a Ponder indexer serving GraphQL event queries, and a Next.js/Wagmi frontend.

Veilfi: Privacy-Preserving Yield Aggregator | *Solidity, ZK Circuits, Web3*

- Built a yield aggregation protocol where users deposit into multiple DeFi strategies and keep their positions private through zero-knowledge proofs.

- Wrote ZK circuits in proofs that verify.

Gasan: Digital Arisan Platform with Escrow | *Python, FastAPI*

- Built a community savings (arisan) platform with automated escrow disbursement to reduce default risk and remove manual verification.
- Implemented to estimate member default risk.

June Label: E-Commerce Website | *Laravel, Inertia.js, React, Filament*

- Delivered an end-to-end e-commerce site with cart, checkout, and a Filament admin panel for managing a premium product gallery.

Velipe: On-Chain Document Verification (Undergraduate Thesis) | *Solidity, Next.js, IPFS, Base Sepolia*

- Built a document notarization system where issuers register through a smart-contract-governed registry and issue documents as a hybrid ERC-721: non-transferable soulbound tokens for academic credentials, transferable NFTs for other digital assets. Anyone can verify authenticity on-chain without an intermediary.
- Stored document metadata on IPFS and recorded only the cryptographic hash on-chain, so owner privacy is preserved and no physical file sits on a server. Deployed on Base Sepolia (L2) to keep transaction costs low.

SathaFly: Flight Tickets as NFTs with Automatic Refunds | *Solidity, ERC-20, NFT, IDRX, Web3*

- Built a dApp for buying flight tickets as NFTs paid with IDRX, where the smart contract executes refunds automatically on delay or cancellation without manual claims.

SKILLS

Languages & Frameworks: Solidity, TypeScript, JavaScript, Python, PHP, Dart, Svelte, React, Next.js, Laravel, FastAPI, Flutter, Node.js, Foundry

Frontend & Mobile: Svelte 5, React, Next.js, Inertia.js, Flutter, HTML5, CSS3, Tailwind CSS, PWA

Blockchain & Web3: Smart Contracts, Zero-Knowledge Proofs (ZK), IPFS, EVM, DeFi, NFT (ERC-721/1155), Wagmi, Ponder Indexer, Base L2

Database & Storage: PostgreSQL, MySQL, Redis, IndexedDB (Dexie.js), Isar NoSQL, Drift, Supabase

Tools & DevOps: Git, Docker, Postman, Figma, Visual Studio Code, FrankenPHP, Octane

Soft Skills: Technical Leadership, System Architecture, Agile Development, Problem-Solving, Cross-Functional Collaboration
